rocks. Igneous rocks are commonly referred to as primary rocks because they are the original source of material found in sedimentaries and metamorphics. Igneous rocks compose the greater part of the earth's crust,but they are generally covered at the surface by a relatively thin layer of sedimentary or metamorphic rocks. Igneous rocks are distinguished by the following characteristics:(1) they contain no fossilis:(2) they have no regular arrangement of layers;and (3) they are nearly always made up of crystals. Sedimentary rocks are composed largely of minute fragments derived from the disintegration of existing rocks and in some instances from the remains of animal As sediments are transported Individual fragments are assorted according to size. Distinct layers of such sediments as gravels, sand, and clay build up as they are deposited by water and occasionally wind. These sediments vary in size with the material and the power of the eroding agent. Sedimentary materials are laid down in layers called strata. When sediments harden into sedimentary rocks, the names applied to them change to indicate the change in physical state. Thus, small stones and gravel cemented together are known as conglomerates; cemented sand becomes sandstone; and hardened clay becomes shale, in addition to these, Other sedimentary rocks such as limestone frequently result from the deposition of dissolved material. The ingredient parts are normally precipitated by organic substance such as shells of clams or hard skeletons of other marine life. Both igneous and sedimentary rocks may be changed by pressure, heat, solution, or cementing action. When individual grains from existing rocks tend to deform and interlock they are called metamorphic rocks. For example granite, an igneous rock, may be metamorphosed into a gneiss or a schist. Limestone, a sedimentary rock, when subjected to heat and pressure may become marble, a metamorphic rock. Shale under pressure becomes slate. Choose the Preposition. Choose the Preposition. Q-7.Observe the dialemma of the fungus: it is a plant,but it possesses no chlorophyll.While all other plants put the sun's energy to work for them

combining he nutrients of ground and air into the body structure, the chlorophyllous fungus must look elsewhere for an energy supply. It finds it in those other plants which, having received their energy free from the sun, relinquish it at some point in their cycle either to animals (like us humans) or to fungi.

In this search for energy the fungus has become the earth's major source of not and decay. Wherever you see mold forming on a piece of bread, or a pile of leaves turning to compost, or a blown-down tree becoming pulp on the ground, you are watching a fungus eating. Without fungus action the earth would be piled high with the dead plant life of past centuries. In fact, certain plants which contain resins that are toxic to fungi will last indefinitely; specimens of the redwood, for instance, can still be found resting on the forest floor centuries after having been blown down.

8

A. Figurative

- B. Ironical
- C. Parenthetical
- D. Erroneous
- E. Contradictory

iii.The authors statements that"you are watching a fungus eating" is best described as?

9	Select the appropriate word that is SIMILAR in meaning to the numbered word.(IDIOMS) To smell a rat	A. To see signs of plague epidemic B. To get bad small of a bad dead rat C. To suspect foul dealings D. To be in a bad mood
